## Abbreviations

ACS	Applied Computer Science.
AIoT	Artificial Intelligence of Things.
HTTP	Hypertext Transfer Protocol.
SDK	Software Development Kit.

## Glossary

Bluetooth	A short-range wireless interconnection of mobile phones, computers, and other electronic devices.
WiFi	A wireless networking technology that uses radio waves to provide high-speed Internet access.

## **1 Introduction**

As part of Project Integration, Applied Computer Science (ACS) students need to conduct research about the ESP32 microcontroller. Upon completion of this research, a set of assignments have to be completed. First, some introductory assignments in order to familiarize ourselves with concepts that are important for the project, followed by a final assignment that goes more in depth into specific topics that are of value for our final product.

## **2 The ESP32**

The ESP32 is a series of microcontrollers developed by Espressif Systems that have integrated WiFi and Bluetooth modules (Espressif, 2024).

## **3 Espressif**

Espressif Systems is a multinational semiconductor company that focusses among other things on developing wireless communication and Artificial Intelligence of Things (AIoT) (Espressif, n.d.). Popular products Espressif created, are the ESP32 series of chips, development boards, and modules (Espressif, n.d.). Espressif supports various open-source software projects such as Software Development Kits (SDKs), libraries, and tools. Espressif is a chinese company but has offices all around the world (Espressif, n.d.).

## **4 Lilygo**

## 5 Assignment 1

Show that the ESP32 can turn three different LEDs on and off separately using an internal loop with delays.

### 5.1 Circuit

For this assignment, the circuit used is quite straightforward. Connect three LEDs to the ESP32, put these LEDs in series with a resistor, and connect them to a common ground. For all subsequent assignments, it can be assumed that the same circuit is used unless explicitly stated otherwise.

### 5.2 Toolchain

For this assignment, I decided on using the ESP-IDF toolchain. More specifically, I used the `idf.py` command line tool in combination with a text editor. I never used the ESP-IDF toolchain before and was curious about what it would be like. One thing I really like about the ESP-IDF toolchain is that it provides a C++ compiler that supports both language and library features of more recent C++ standards, which is something the Arduino IDE lacks.

## 5.3 Software

```
#include <array>
#include <chrono>
#include <ranges>
#include <thread>

#include "driver/gpio.h"
#include "rom/gpio.h"

extern "C" void app_main() {
    const std::array<gpio_num_t, 3> led_pins{
        GPIO_NUM_12,
        GPIO_NUM_14,
        GPIO_NUM_27,
    };

    // configure the pins for output
    for (auto pin : led_pins) {
        gpio_pad_select_gpio(pin);
        gpio_reset_pin(pin);
        gpio_set_direction(pin, GPIO_MODE_OUTPUT);
    }

    // blink individual LEDs indefinitely
    for (auto pin : std::views::join(std::views::repeat(led_pins))) {
        gpio_set_level(pin, 1);
        std::this_thread::sleep_for(std::chrono::seconds{1});
        gpio_set_level(pin, 0);
    }
}
```

## 6 Assignment 2

Show that the ESP32 can turn three different LEDs on and off separately by sending commands over the serial interface.

### 6.1 Toolchain

Just like the previous one, for this assignment I have used the ESP-IDF toolchain. The ESP-IDF toolchain provides good C++ support. From the UART can be read using `std::cin`, but to get the usual behaviour, our program needs to initialize the UART driver first.

## 6.2 Software

```
#include <iostream>
#include <map>
#include <ranges>

#include "driver/gpio.h"
#include "driver/uart.h"
#include "esp_vfs_dev.h"
#include "rom/gpio.h"

void toggle(gpio_num_t pin) {
    int level = gpio_get_level(pin) ^ 1;
    gpio_set_level(pin, level);
}

extern "C" void app_main() {
    // configure stdin to use blocking mode
    setvbuf(stdin, nullptr, _IONBF, 0);
    constexpr auto uart_num = CONFIG_ESP_CONSOLE_UART_NUM;
    uart_driver_install(static_cast<uart_port_t>(uart_num), 256, 0, 0, nullptr, 0);
    esp_vfs_dev_uart_use_driver(uart_num);

    const std::map<char, gpio_num_t> led_pins{
        {'0', GPIO_NUM_12},
        {'1', GPIO_NUM_14},
        {'2', GPIO_NUM_27},
    };

    // configure the pins for input and output
    for (auto pin : led_pins | std::views::values) {
        gpio_pad_select_gpio(pin);
        gpio_reset_pin(pin);
        gpio_set_direction(pin, GPIO_MODE_INPUT_OUTPUT);
    }

    for (char ch : std::views::istream<char>(std::cin)) {
        if (auto it = led_pins.find(ch); it != led_pins.end()) {
            toggle(it->second);
        }
    }
}
```

## **7 Assignment 4**

Show that the ESP32 can turn three different LEDs on and off separately. Connect the ESP32 to a WiFi access point and host a webserver on the ESP32 to control the LEDs.

### **7.1 Toolchain**

### **7.2 Software**

`https://github.com/jochemarends/project-integration/tree/main/leds-wifi`

## 8 Final Assignment

For the final assignment, I decided to manage a database using SQL and the ESP32. I chose this assignment because the high chance that the ESP32 has to interact with a database for the final product.

## 9 Demonstration Setup

### 9.1 Used Software Libraries

For the client I have used the libraries that come with ESP-IDF. These libraries allowed me among other things to establish a WiFi connection and perform Hypertext Transfer Protocol (HTTP) requests. For the server I used a Go package that provides a Go driver for MySQL, which can be found at: <https://github.com/go-sql-driver/mysql>. I made use of Go's standard library for working with HTTP.

### 9.2 Software Architecture

The software consists of three major components: a HTTP client, a HTTP server, and a database. Of these components, the HTTP server and the database are hosted on a Raspberry Pi, while the HTTP client runs on an ESP32. The HTTP client communicates with the HTTP server, which in turn communicates with the database. The ESP32 is interacting with the database via a web server as hosting a SQL client would be a very intensive task for a microcontroller.

### 9.3 Results

I did not experience any problems when working on this assignment. However, I did come across some challenges for the design. At first instance I thought a SQL client is

## **9.4 Accountability**

I have done this assignment by myself.
